

Final Project: The Relationship between Sleep, Depression, Quality of Life, and
Socioeconomic Status

Abstract

One or two sentences providing a **basic introduction** to the field, comprehensible to a scientist in any discipline.

Two to three sentences of **more detailed background**, comprehensible to scientists in related disciplines.

One sentence clearly stating the **general problem** being addressed by this particular study.

One sentence summarizing the main result (with the words “**here we show**” or their equivalent).

Two or three sentences explaining what the **main result** reveals in direct comparison to what was thought to be the case previously, or how the main result adds to previous knowledge.

One or two sentences to put the results into a more **general context**.

Two or three sentences to provide a **broader perspective**, readily comprehensible to a scientist in any discipline.

Keywords: sleep, depression, quality of life, SES

Word count: X

Final Project: The Relationship between Sleep, Depression, Quality of Life, and Socioeconomic Status

Methods¹

Participants

Participants were recruited through the University of Oregon Human Subjects Pool consisting of undergraduate students enrolled in introductory psychology and linguistics courses. Students received academic credit in exchange for their participation. Participants were not aware of the subject of the study before scheduling their participation, so participants did not self-select into the study. Although they could leave the study after reading informed consent, no participants chose to do so.

In total, [#] participants were included in this study, all of who had complete data.
[insert demographic characteristics]

Materials

Depressive Symptoms Scale. A scale to measure depressive symptoms was created by the researchers for the purposes of this study. Participants were instructed to rate each item on Likert-type scale, where 1 corresponds to “strongly disagree,” and 5 corresponds to “strongly agree.” The scale consisted of three items, including: “Over the last 2 weeks, I have felt little interest or pleasure in doing things;” “Over the last 2 weeks, I have felt down, depressed, or hopeless;” and “Over the last 2 weeks, I have felt tired or had little

¹ This is a fictional Methods section, as we simulated our data. However, this is a realistic way that we could go about collecting this information in the future

energy.” Scale items were summed to create a depression score, where higher scores represent higher depressive symptoms.

Quality of Life Scale. A scale to measure participants’ quality of life was created by the researchers. Participants were instructed to rate each item on Likert-type scale, where 1 corresponds to “strongly disagree,” and 5 corresponds to “strongly agree.” The scale consisted of four items, including: “My life is ideal;” “I am satisfied with my life;” “So far I have been able get the important things I want from life;” and “I have accomplished many of the things in my life.” Scale items were summed to create a total quality of life score, where higher scores represent better quality of life.

Sleep Quality Scale. A scale to measure participants’ sleep quality was created by the researchers. Participants were instructed to rate each item on Likert-type scale, where 1 corresponds to “strongly disagree,” and 5 corresponds to “strongly agree.” The scale consisted of three items, including: “I am satisfied with the time I spend sleeping;” “I am satisfied with my quality of sleep”; and “When I wake up, I feel refreshed.” Scale items were summed to create a total sleep quality score, where higher scores represent better sleep quality.

Demographics Questionnaire. Participants were also asked to complete a demongraphics quationnaire, which asked about their socioeconomic status, race/ethnicity, and educational background.

Procedure

An online version of this study was created through Qualtrics survey software, and the survey link was distributed to participants on the via SONA software through the University of Oregon Human Subjects pool. After clicking the survey link, participants were informed of study procedures and content through an informed consent process. After completing the

study, participants received academic credit as compensation and were presented with debriefing materials. The University of Oregon's Office of Research Compliance (Institutional Review Board) approved this study.

Data analysis

We used R (Version 3.4.3; R Core Team, 2017) and the R-packages *bindrcpp* (Version 0.2.2; Müller, 2018), *dplyr* (Version 0.7.6; Wickham, François, Henry, & Müller, 2018), *forcats* (Version 0.3.0; Wickham, 2018a), *Formula* (Version 1.2.3; Zeileis & Croissant, 2010), *ggplot2* (Version 3.0.0; Wickham, 2016), *gridExtra* (Version 2.3; Auguie, 2017), *here* (Version 0.1; Müller, 2017), *Hmisc* (Version 4.1.1; Harrell Jr, Charles Dupont, & others., 2018), *janitor* (Version 1.1.1; Firke, 2018), *kableExtra* (Version 0.9.0; Zhu, 2018), *knitr* (Version 1.20; Xie, 2015), *lattice* (Version 0.20.35; Sarkar, 2008), *papaja* (Version 0.1.0.9842; Aust & Barth, 2018), *purrr* (Version 0.2.5; Henry & Wickham, 2018), *readr* (Version 1.1.1; Wickham, Hester, & François, 2017), *rio* (Version 0.5.10; C.-h. Chan, Chan, Leeper, & Becker, 2018), *stringr* (Version 1.3.1; Wickham, 2018b), *survival* (Version 2.42.6; Terry M. Therneau & Patricia M. Grambsch, 2000), *tibble* (Version 1.4.2; Müller & Wickham, 2018), *tidyr* (Version 0.8.1; Wickham & Henry, 2018), and *tidyverse* (Version 1.2.1; Wickham, 2017) for all our analyses. We calculated means and standard deviations for each of the total scale scores. We also calculated Pearson's r correlation coefficients between depressive symptoms, quality of life, and sleep quality total scores. The authors interpreted our correlational results as small (.10-.29), medium (.30-.49), and large correlations (.50-1.00).

Results

Descriptive Statistics

The mean depression total score for the sample is 7.31 . The mean sleep quality total score for the sample is 13.54. The mean quality of life total score for the sample is 9.97. Mean total scores separated by socioeconomic status are listed in Table 1 and graphically displayed in Figure 1.

Correlation Results

Depressive symptoms, sleep quality, and quality of life scores were significantly correlated with each other, $p < .05$ (see Table 2).

Exploratory Analyses in Low SES Individuals

The relationships between these depressive symptoms, sleep quality, and quality of life scores in low SES individuals are displayed in Figure 2.

Table 1

Mean Depression, Sleep Quality, and Quality of Life Scores by SES Group.

SES	Mean Depression Score	Mean Sleep Quality Score	Mean Quality of Life Score
High	7.30	12.52	9.89
Low	7.38	13.41	10.02
Med	7.25	13.86	9.94

Note. This table was created with `apa_table()`

Table 2

Correlations between Depression, Sleep Quality, and Quality of Life Scores.

row	column	cor	p
Mean Sleep Quality Score	Mean Depression Score	-0.19	0.00
Mean Sleep Quality Score	Mean Quality of Life Score	-0.11	0.06
Mean Depression Score	Mean Quality of Life Score	-0.17	0.00

Note. This table was created with apa_table()
